PLOT BER vs E/N_0 FOR BCH CODERS OVER AWGN CHANNEL

Results:

Below is the graph of BER (Bit Error Rate) and E/N_0 ratio for three different cases, namely,

- i) No channel coding
- ii) (15,11) BCH
- iii) (15,7) BCH

We observe that BER is maximum in case of no channel coding; less in case of (15,11) BCH and even lesser in case of (15,7) BCH. This is because (15,7) code can correct two bit errors whereas (15,11) code can correct only one bit error. These three plots are for the same range of E/N_0 values.
